Tue, 19 Jun 2018 20:06:00 GMT - An electron transport chain (ETC) is a series of complexes that transfer electrons from electron donors to electron acceptors via redox (both reduction and oxidation occurring simultaneously) reactions, and couples this electron transfer with the transfer of protons (H⁺ ions) across a membrane.

Sat, 16 Jun 2018 10:22:00 GMT - NADH is oxidized into NAD⁺, H⁺ ions, and electrons by an enzyme. FADH₂ is also oxidized into H⁺ ions, electrons, and FAD. As those electrons travel farther through the electron transport chain in the inner membrane, energy is gradually released and used to pump the hydrogen ions from the splitting of NADH and FADH₂ into the space between ...
